

How to program Boss RD1 BHT1, BHT2, HT1. 310Mhz

Smooth remotes Clone these and don't need programming to the receiver.

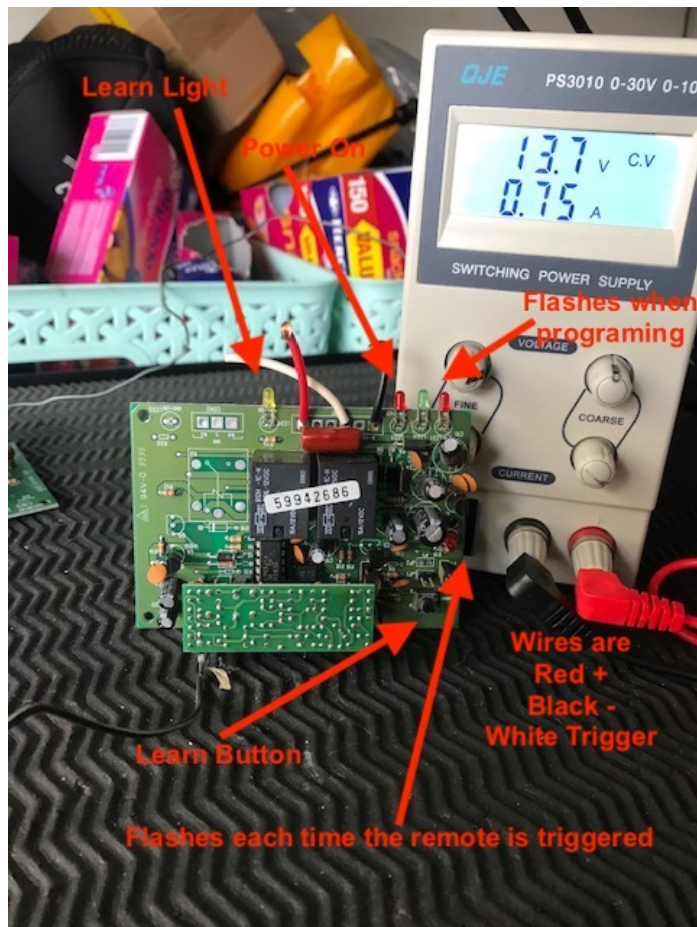

Same for the clone remotes SW044

If you have to program any remotes to one of these do it as follows.

The SW044 should have its own frequency that matches if you're lucky if they do not have any remotes.

- In side on the board push and hold the learn button for about 2 to 3 seconds till the yellow light comes on.
- Then push and hold a button on the remote you want to program in and the green light in between the 2 red lights will flash.
- This then tells you the remote is accepted BUT if the red one flashes then that tells you that you just deleted the remote from the receiver. (Green flashes then it's in / Red flashes then its deleted)
- If nothing flashes then the receiver is not receiving the remote.

Then all you have to do is wait till the yellow learn light goes off and test it.

310Mhz Old Type
