

Centsys Solar Notes;

On a D2 that is a High Voltage Straight to mains power | If you connect a solar system to one then it has to have a proper voltage regulator just like the D5.

Also, if it is connected to Solar and not plugged in AC 240-volt power | make sure the bottom setting knob is set to solar, so it does not beep all the time while opening and closing.

On a D2 that is low voltage it does not need a voltage regulator in it as its built into the unit.

On a D5 it needs voltage regulator fitted.

Recommended minimum solar panel to use with any is 40 watts.

And should have at least a 18amp hour battery to allow for cloudy days.

One 7-amp battery will only last 2 days on a cloudy day.

One 18amp battery will last 4 to maybe 5 days on a cloudy day.

36 amps is available and will last a week on cloudy days.
